PROFILE SUMMARY

I'm Abdul Basith, a Flutter Developer with hands-on experience building mobile and web applications through an immersive training program and real-world projects. I mainly work with Flutter and Dart, along with Firebase, REST APIs, BLoC, Provider, and GetX. Through my training and projects, I've worked on features like authentication, database integration, payments, real-time chat, and responsive web applications. I'm a quick learner, dedicated, and adaptable, and I enjoy learning new technologies and solving problems through practical work. I'm looking for an opportunity where I can contribute to the team, learn from others, improve my skills, and grow as a developer.

TECHNICAL SKILLS

Languages	:	Dart, JavaScript, HTML, CSS
Frameworks & UI	:	Flutter, Bootstrap, Responsive UI, Custom Widgets
State Management	:	BLoC , Provider, GetX
Backend & Database	:	Firebase Authentication, Cloud Firestore, Realtime Database, Firebase Storage
API Integration	:	REST APIs, Dio, JSON Parsing
Local Storage	:	Hive, SQLite, SharedPreferences, Flutter Secure Storage
Architecture	:	Clean Architecture, MVVM, MVC
Tools	:	Git, GitHub, Android Studio, VS Code, Figma

PROJECTS

Featured Projects

ChoiceX – E-Commerce Platform
Flutter,Dart, Firebase, REST APIs, BLoC, Provider, GetX

GitHub - User | GitHub - Seller | GitHub - Admin
APK - Customer | Live - Seller | Live - Admin

- **ChoiceX** is a full-stack, multi-vendor e-commerce platform built to solve the challenge of discovering and purchasing electronic gadgets from different brands through a single platform. I designed the system with three separate applications — a **Customer mobile app, Seller web app, and Admin web app** — connected to a centralized Firebase backend.
- The customer journey starts with authentication and product discovery, where users can explore products, compare variants, view ratings and similar products, and continue through wishlist, cart, coupons, and **Stripe-powered payments**. After purchase, users can track orders, manage returns and refunds, receive notifications, and communicate directly with sellers through real-time chat supporting text, images, emojis, and voice messages.
- To support the business workflow, I built a dedicated Seller application for managing products, inventory, orders, returns, refunds, and customer communication, along with dashboards showing revenue and sales insights. The Admin application provides centralized control over sellers, customers, products, brands, categories, coupons, promotions, orders, and return/refund approvals.
- From a technical perspective, I implemented role-based access and feature-based architecture using **Flutter and Dart**, with **BLoC, Provider, and GetX** for state management. The platform integrates **Firebase Authentication, Cloud Firestore, Firebase Storage, Firebase Realtime Database, REST APIs, SharedPreferences, and Stripe**, with responsive layouts supporting both mobile and web platforms.

Movie Review Hub
Flutter, Dart, Hive, SharedPreferences

GitHub - Movie Review
APK - Movie Review

- **Movie Review Hub** is a movie review application I built to give users a single place to discover recently released movies, watch trailers, and read reviews before deciding whether a movie is worth watching. The main idea was to make it easier for users to explore movies and make decisions based on reviews and ratings from other users.

- The application has separate **User and Admin roles**. Users can browse available movies, view movie details, watch trailers, check ratings and reviews, and share their own opinions by writing reviews and participating in the comment section. Admins have a separate login through which they can add, update, and manage movies, trailers, reviews, and other platform content.
- I used **Hive** as the local database to store and manage application data efficiently and implemented authentication and CRUD operations for managing the movie and review content. The project follows a **local-first approach**, with the structure prepared for future integration with cloud-based data synchronization and wider access.

Additional Projects

Thinksy AI – AI Chat Application GitHub - Thinksy AI

Flutter, Dart, BLoC, Clean Architecture, Firebase Auth, Dio, Gemini API

- Developed an AI-powered chat application using Flutter and Google Gemini API, enabling users to ask questions and receive AI-generated responses.
- Applied feature-based Clean Architecture with separate Data, Domain, and Presentation layers to maintain separation of concerns and scalability.
- Integrated Firebase Authentication and Gemini API using Dio, with BLoC for state management and conversation context handling.

News App GitHub - News App

Flutter, Dart, NewsAPI, Firebase

- Developed a news application using Firebase Authentication and NewsAPI.
- Used Firebase Remote Config for dynamic country-based configuration.

Netflix Clone – Movie Discovery Application GitHub - Netflix Clone | Figma - Netflix Clone

Flutter, Dart, BLoC, Dio, REST API, TMDB, Repository Pattern

- Developed a Netflix-inspired movie discovery application featuring seven screens, including Home, Search, Coming Soon, Downloads, and Profile.
- Integrated multiple TMDB REST API endpoints to fetch movies and TV shows, implementing dynamic content sections and debounced search functionality.
- Structured API integration using Dio, repositories, data sources, and typed models, with BLoC for state management and loading, empty, and error handling.

To-Do List App GitHub - To-Do List

Flutter, Dart, Firebase, Cloud Firestore

- Developed a task management application with Firestore CRUD operations.
- Implemented task creation, updating, deletion, due dates, and completion status.

Native Features GitHub - Native Features

Flutter, Dart, MethodChannel, Android Native

- Built a Flutter application to integrate native Android features using MethodChannel.
- Implemented communication between Flutter and native Android code for GPS, camera, and accelerometer features.

Expenzia – Expense Tracker Application GitHub - Expenzia | Figma - Expenzia

Flutter, Dart, BLoC, Clean Architecture

- Developed an expense-tracking application featuring income and expense management, transaction history, and dashboard insights.
- Applied BLoC for state management and Clean Architecture to separate presentation, domain, and data layers.

Other Stack Projects

Responsive Website Clones GitHub - 7UP | GitHub - Kopiko | GitHub - Tesla

HTML, CSS, Bootstrap, JavaScript Live - 7UP | Live - Kopiko | Live - Tesla

- Developed responsive website clones inspired by 7UP, Tesla, and Kopiko.
- Used HTML, CSS, Bootstrap, and JavaScript to create responsive layouts.

Education

Pradarshini College of Arts and Science 2021 – 2025
Bachelor of Commerce (Cooperation) *Calicut University, Kerala*

Brototype 2024 – 2026
Immersive Flutter Development Program *Calicut, Kerala, India*

Additional Information

- Strong understanding of **Object-Oriented Programming, Data Structures and Algorithms**, with an understanding of **Software Architecture**.

Languages

- **Malayalam** – Native
- **English** – Professional Working Proficiency
